

The background of the entire page is a complex, abstract pattern of thin, dark grey lines. These lines intersect at various angles, creating a dense, web-like structure that resembles a technical drawing or a modern architectural sketch. The lines vary in length and orientation, some running parallel while others cross at sharp angles.

## VERTICAL FARM

considered one of the world's foremost experts on vertical farms – a theoretical concept that may offer the panacea to our food production problems in the future. Supporters and critics of this concept abound, with fans proudly touting the benefits of towering botanical skyscrapers and naysayers concerned with how vertical farming could be misused, poorly executed and could rack up extreme costs. They could also save energy, reduce toxins, save water, provide new employment opportunities, restore ecosystems, and much more.

Green building concept and the using of processes that are environmentally responsible and resource-efficient throughout a building's life-cycle – from siting to design, construction, operation, maintenance, renovation, and demolition. Green building design involves finding the balance between homebuilding and the sustainable environment.

# HOTEL TOWER

the realm of dreams An ideal world

The new skin proposes to connect the horizontal component of the city network with the verticality of the tower by maintaining and exploiting the potential of the passage as a social condenser. Public space is not only around the tower, it is being integrated to it as a continuous cavity connecting people together.

The existing structure is wrapped in a faceted skin in order to dissolve the monolithic form of the tower. Each facet has a different density and provides a hierarchy of scalar articulations that addresses the tower's range of visibility from the inhabiting user to the long-view. It sets a variety of illumination, enclosure and transparency conditions to create unique atmospheres depending on the program and the solar orientation.

In order to avoid the monotony of the interior space, the project supposes the appropriation of the space in-between the original and the new envelope. It lets room to the insertion of terraces, fire stairs and meeting areas. The new envelope derives from the superposition of different layers. The primary structure is generated by an assembly of lame steel structure, attached to the existing slabs and columns to distribute self-weight and lateral loads. Glass panels are inserted in between, while an outside layer composed with aluminium panels provides different degrees of privacy and connection with the outside.

The double-skin façade permits to exhaust hot air from the interior in summer, while in the cold season, air warmed in the plenum can be drawn into the interior through the operable windows to increase the environmental performance of the building. The building gains its energy through solar energy sheets set in the high positions of the building in order to provide building with power.

# RENOVATION

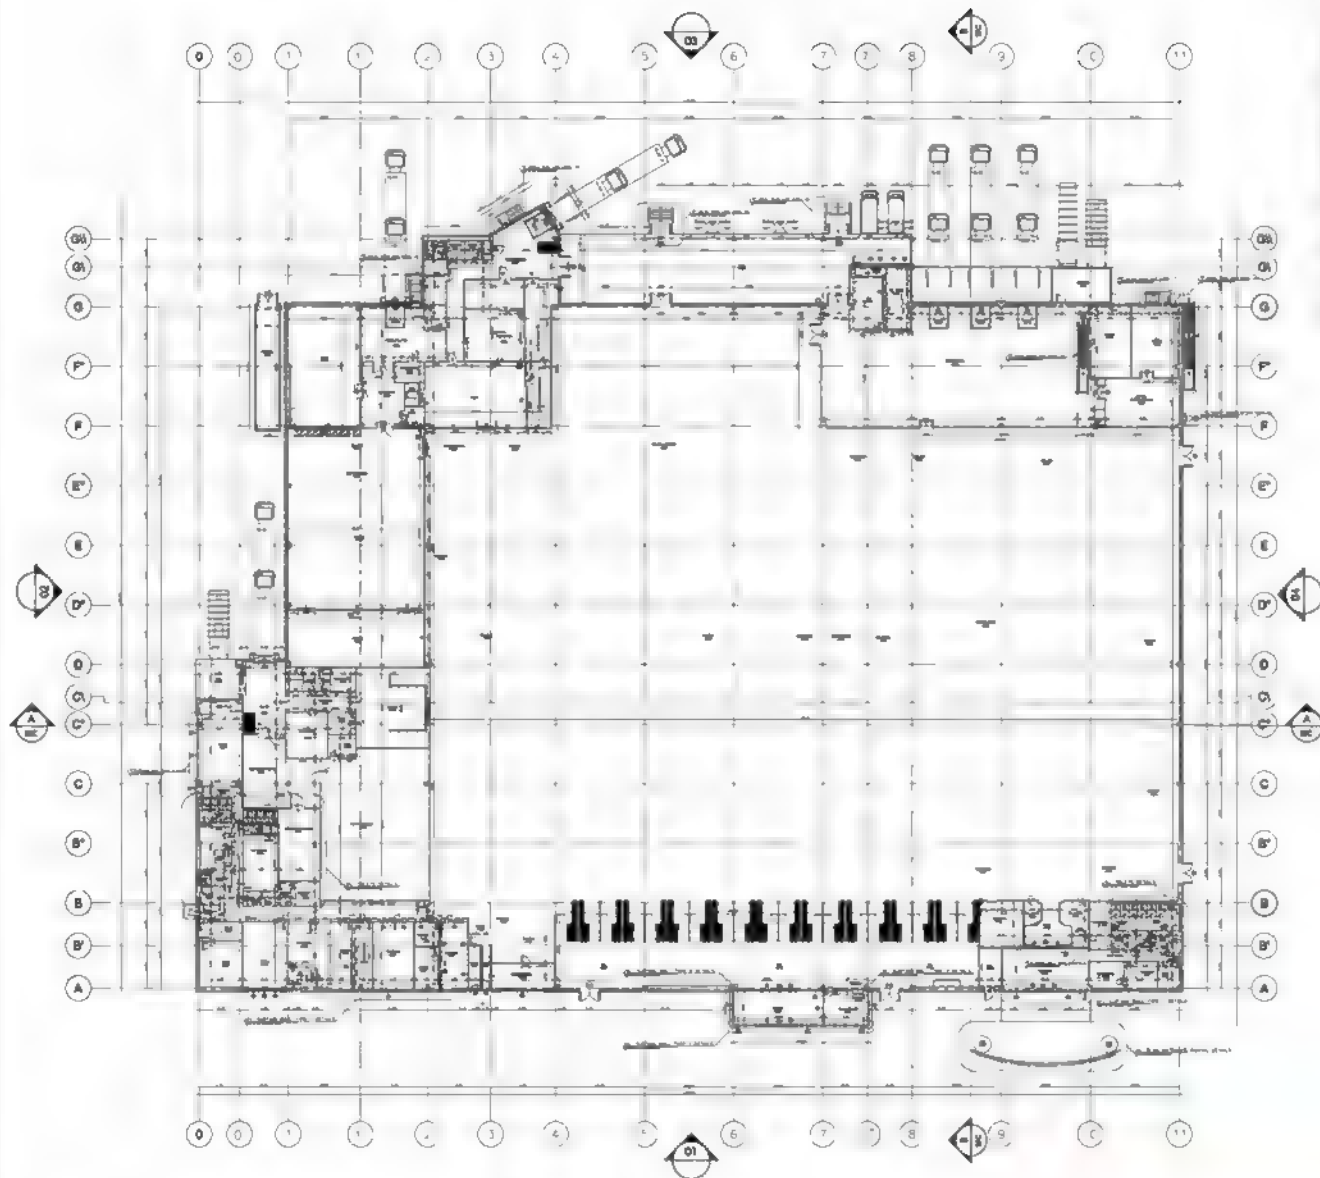

OLD HISTORICAL BUILDING

Garden City Cairo, Egypt

## PLANS/INTERIOR VISION

# GROUND FLOOR PLAN

# makro

## ELEVATIONS/FACADES

Makro is an international brand of Warehouse clubs, also called cash and carries. Originally a Dutch-based chain, the first one opened in Amsterdam in 1968. In the following years more stores opened in the Netherlands and in several other European countries and, in 1971, South Africa. In the 1970s and 1980s Makro extended its business to the Americas and Asia. Makro had also expanded to the United States in the mid-1980s. In 1989, Kmart bought the US locations, and converted most of them to Price Warehouse in 1990. In 1998, Makro owner SHV Holdings sold the Makro stores in Europe to Metro AG. Makro Opened they new branch in Egypt in 2009 to fill need of their customers.

chain all over the world, by using corrugated sheets and curtain wall the idea was to have a huge space inside (function over design) main duty of the design is to be compatible with Egypt's atmosphere by using material that obtain the heat / reflect sun rays, also in addition of this to manage circulation of the customers, services and dealers.

# KIA MOTORS

## KIA Motors Exhibition architectural idea and concept :

The new Kia exhibition stand. Central theme of the new exhibition design is the "frozen motion" of a sea wave, composed of several architectural elements.

The stand concept is to be understood as a walk-in sculpture with a unique spatial effect. The most characteristic element of

the ceiling. Sculptural walls and the sculptural columns are designed and arranged to create the impression of a moving wave.

These elements determine the new articulated appearance and recognition of Kia brand all over the world.

All exhibition items of the stand design have different functions. They are specified in detail and explained regarding overall dimensions, material, color and function in the following section. The following illustrations shows the different sizes of the Kia display booth, presented for different locations.

The ribs are the basic elements of the stand. They dictate the whole shape and appearance of the booth and create the "frozen wave sculpture".

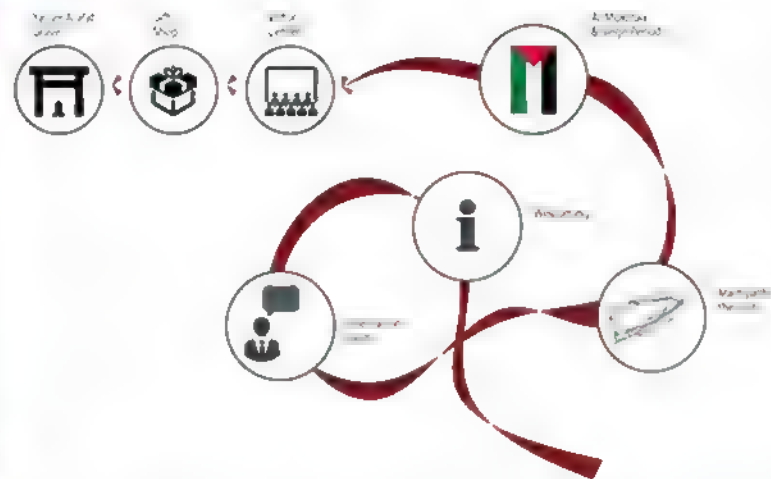

Motion and dynamics is the concept for the new Kia exhibition stand. Central theme of the new exhibition design is the "frozen motion" of a sea wave, composed by several architectural element.

A museum's role in society is to preserve the memory of the nation and its message is primarily directed towards children and youth as well as professionals, scholars and specialists.

Museums in general should pique the visitor's curiosity and knowledge as well as their eagerness to know more especially those about influential historic personas in the field of politics.

Displaying a timeline full of historic events in a specific period of time in a way that manages to pique the visitor's curiosity without a classroom-like atmosphere is quite difficult. As such, we had to enrich the display with an array of media to ensure diversity in the museum's narrative, thus breaking the monotony the visitor may experience as a result of the repetition and similarity of the events displayed.

Between the ramps there is a space that serves as a resting place for visitors to review the events displayed in the previous ramp and to prepare them for the events in the ramp to follow. Each space is identified by a clear illuminated sign showing the historic events displayed in the following ramp.

At the end of the fourth ramp, we reach Al Mukataa which represents the state and which accommodates the president's office and his living quarters. Also displayed here is the period of the siege, the president's illness before his travel abroad for treatment where he died on the 10th of November 2004.

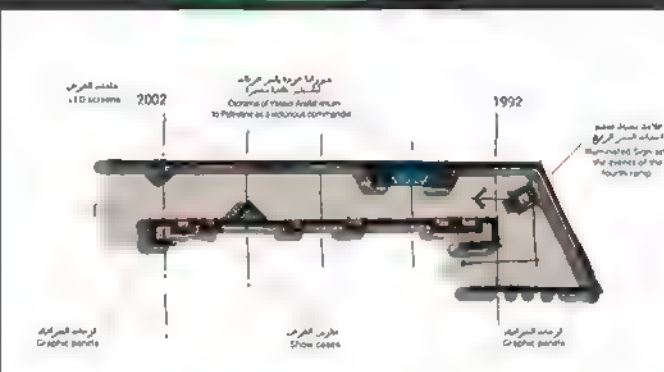

Thus, the following media were used in the display:

1- Showcases, displaying all available documents, papers and materials in need of conservation and as such need to be placed inside showcases.

2- LED screens in different sizes to display sequences of photos and documentaries either already available or made especially for the display.

3- Dioramas, which were not used frequently due to the limited area of the museum as such only one diorama was used in each ramp. Dioramas have the ability to attract groups of visitors at a time and can be used to memorize meanings and messages.

4- Graphic panels, posters and labels which complement the display.

## HEALTH-CARE MEDICAL CENTER ZONING PLAN

## Theory and architectural concept:

The center is located on the ground floor of a building in Maadi, measuring the area and re-zoning according to requirements.

The walls are painted creamy white to evoke the cleanliness of a medical practice, also the porcelain tiles in the ground are preserved for their character. Also custom leather designed all of the furniture for the space, apart from the desk and chairs, to introduce modern shapes and to recall various aspects of the human anatomy.

Strips of gypsum board and lights designed to mark the pathways inside this clinic.

Panels made from solid surface material back painted glass with LED beams line the middle section of the walls, and feature carvings that form a pattern and allow LED lights to shine through from behind. Introducing the green parts (trees and palms) to add natural color to the design.

## DESIGN ABSTRACT

First appearances are always important, which is why the front of your house should make a good expression and be the ultimate expression of your style contemporary colours and materials, with beautiful landscaping.

The concept of contemporary exterior is considered as modern design in architectural focuses. This is the idea of the trendiest matter. But it is possible to add older elements as far as they are suitable for all times. The important point is that the design should be based on the purpose.

The exterior of the home mimic the form of the interior designs that have been chosen. large windows provides natural lighting inside.

**CAD FILES TO BE PRESENTED WHEN NEEDED.**

Arch. Mohammed Amin Ali Al-Hagracy Architectural and Interior Designer. Tel. +20 1006754785  
E-mail : iHagrasy@Hotmail.com

## ABOUT & LOCATION

The European Reef located on the Alex-Cairo desert road, main theme of the compound is full of green areas, the design took place to add more green by adding green roofs using LEEDs building technology

Land Area 4046.85 sqm  
Building Area 1080 sqm  
Tree House 200 sqm

## THEORIES/CONCEPTUAL

### Design Considerations:

Green roofs function independent of the infiltration capacity of the site soils and can be applied to residential buildings, although they are most appropriate for commercial and industrial use. Extensive and intensive green roofs require a minimum slope of 2%; those with slopes less than 2% require additional drainage measures to avoid water logging. Additional requirements include good drainage, lightweight growth media, good waterproofing, additional structural support, rainwater harvesting and the use of drought/heat tolerant plants. While it may be challenging, it is important to engineer for proper drainage, which will avoid root rot on the plants. A thicker substrate needed if drainage is not adequate will also mean higher load bearing, which adds to the cost.

Components of green roofs include: 1.) waterproofing membranes; 2.) insulation (if the building is heated or cooled); 3.) a root barrier to protect the membrane (made of gravel, impervious concrete, pvc, tpo, hdpe, or copper); 4.) a drainage system; 5.) a filter cloth (polyester fiber mats, polypropylene mats or non-biodegradable fabrics); 6.) a growing medium, consisting of inorganic matter (expanded slate, pumice, vermiculite, volcanic rock, etc.) organic material (straw, peat, wood, grass, sawdust etc.), and air (cavities); 7.) plants.

There are several considerations when choosing the plant material. Overall, plants should be selected for their ability to thrive with minimal to no inputs (water, fertilizers, etc.) after establishment. Appropriate natives are recommended and all should prefer full-sun and be drought tolerant. Plants should also be cold tolerant and have no severe pest susceptibility or maintenance needs. Root systems should be shallow. Use pollen/nectar producers when possible, which will help not only in pollination but also to attract beneficial insects for biological pest management.

### Operations and Maintenance:

Although plants should be chosen to be maintenance free after establishment, plants will need some maintenance, particularly during establishment, including irrigation system inspections. Annual maintenance walks should be performed until plants fill in.

## PLAN CONTENTS

### HOUSE CONTENTS:

- 4 Suites including Bathrooms, Green roof and dressing.
- 2 Guest Bedrooms.
- 1 Master bedroom including master-bathroom, 2 Walk in Closet him/her, 2 Green roofs with fireplace and water feature.
- 1 Family living area including Fireplace and Kitchenette, Play area.
- 1 Nanny's Bedroom
- 1 Reception/Salon area, Fireplace area.
- 1 Dining area.

- 1 Hard kitchen
- 1 Outdoor Seating area.
- 1 Triple height parlor with green landscape feature
- 2 servants rooms.

### TREE HOUSE

- 1 Living area.
- 1 Kitchenette.
- Showers and sauna/steam

## INSPIRATION

### Water Protection Benefits:

**Water conservation implications** - When used in conjunction with cisterns for stormwater management, green roofs can allow for more consistent capture and provision of harvested rainwater, with the potential to indirectly reduce potable water demands for landscape irrigation.

**Stormwater Implications** - By intercepting, retaining, detaining, and filtering rainwater at the beginning of the stormwater treatment train, green roofs can play an important role in source control stormwater management, reducing stress on downstream treatment systems.
